[Publications](#)

[News](#)

Artificial Intelligence (AI) and Machine Learning (ML) includes a broad suite of flexible data-driven empirical approaches to perform tasks that are difficult to implement using conventional methods. AI and ML harness the power of computing resources to evaluate the underlying patterns and relationships within a dataset without explicit instructions.

The North Atlantic–Appalachian AI/ML Capability Team is comprised of staff with a wide variety of scientific backgrounds who are united by the desire to improve how data is collected and interpreted using AI and ML. As AI/ML is a rapidly changing and evolving field of data science, the capability team is a resource for sharing information, connecting problems with expert knowledge, and lowering the barriers for entry into applying AI/ML to solve earth science problems.

About Yukon Inter-Tribal Watershed Council Water Quality

→ Project overview

A general description of the project

The Indigenous Observation Network (ION) is the largest international, Indigenous initiative combining Indigenous Knowledge and western science to research, sustain and protect the Yukon River Watershed, its resources and cultures. ION is a network of communities along the Yukon River and its tributaries who conduct research and monitoring that is applicable at the community, watershed, circumpolar and global scales; an amazing feat in the world of science.

Welcome to the Nonindigenous Aquatic Species (NAS) information resource for the United States Geological Survey. Located at Gainesville, Florida, this site has been established as a central repository for spatially referenced biogeographic accounts of introduced aquatic species. The program provides scientific reports, online/realtime queries, spatial data sets, distribution maps, and general information. The data are made available for use by biologists, interagency groups, and the general public. The geographical coverage is the United States.

Search

Search for NAS records via our custom spatial query map.

Headwater streams are under-monitored

- There is a gap between where we monitor streamflow (large streams) and where the most stream-miles are (small streams).
- Inexpensive cameras can **extend** existing monitoring networks to fill this monitoring gap.
- The imagery can be turned into quantitative streamflow estimates using innovative AI-based techniques.

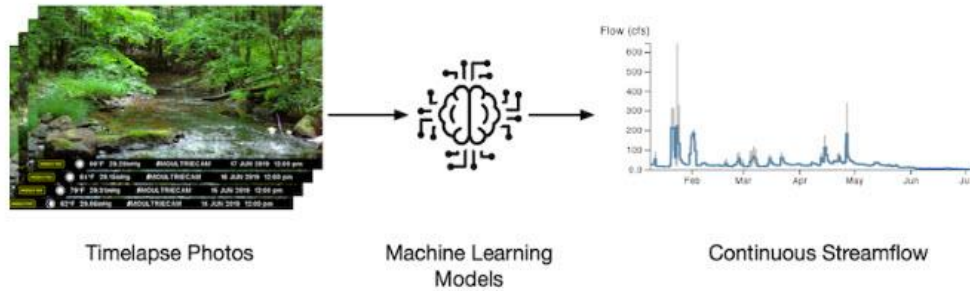

Relative number of USGS gages by stream order for the northeastern United States. Smallest stream are at the top. Number of streams is on the left and number of gaged streams is on the right. Headwaters in orange. Sources: USGS NWIS and NHD+. Figure developed in collaboration with Cee Nell.

Welcome to the Flow Photo Explorer

The **Flow Photo Explorer** is an integrated database, machine learning, and data visualization platform for monitoring streamflow and other hydrologic conditions using timelapse images.

The goal of this project is to develop new approaches to hydrologic monitoring in streams and rivers where flow data are historically sparse or non-existent.

Blotchy Bass Syndrome

History:

- 'Blotchy' largemouth bass were first reported in the 1980's (Hudson River, NY)

Affected fish:

- Reported in both adult largemouth and smallmouth bass (> 175 mm).
- Casual reports in rock bass and sunfishes

Potomac River, MD

Susquehanna River, PA

Lake Erie, OH

Ohio River, WV

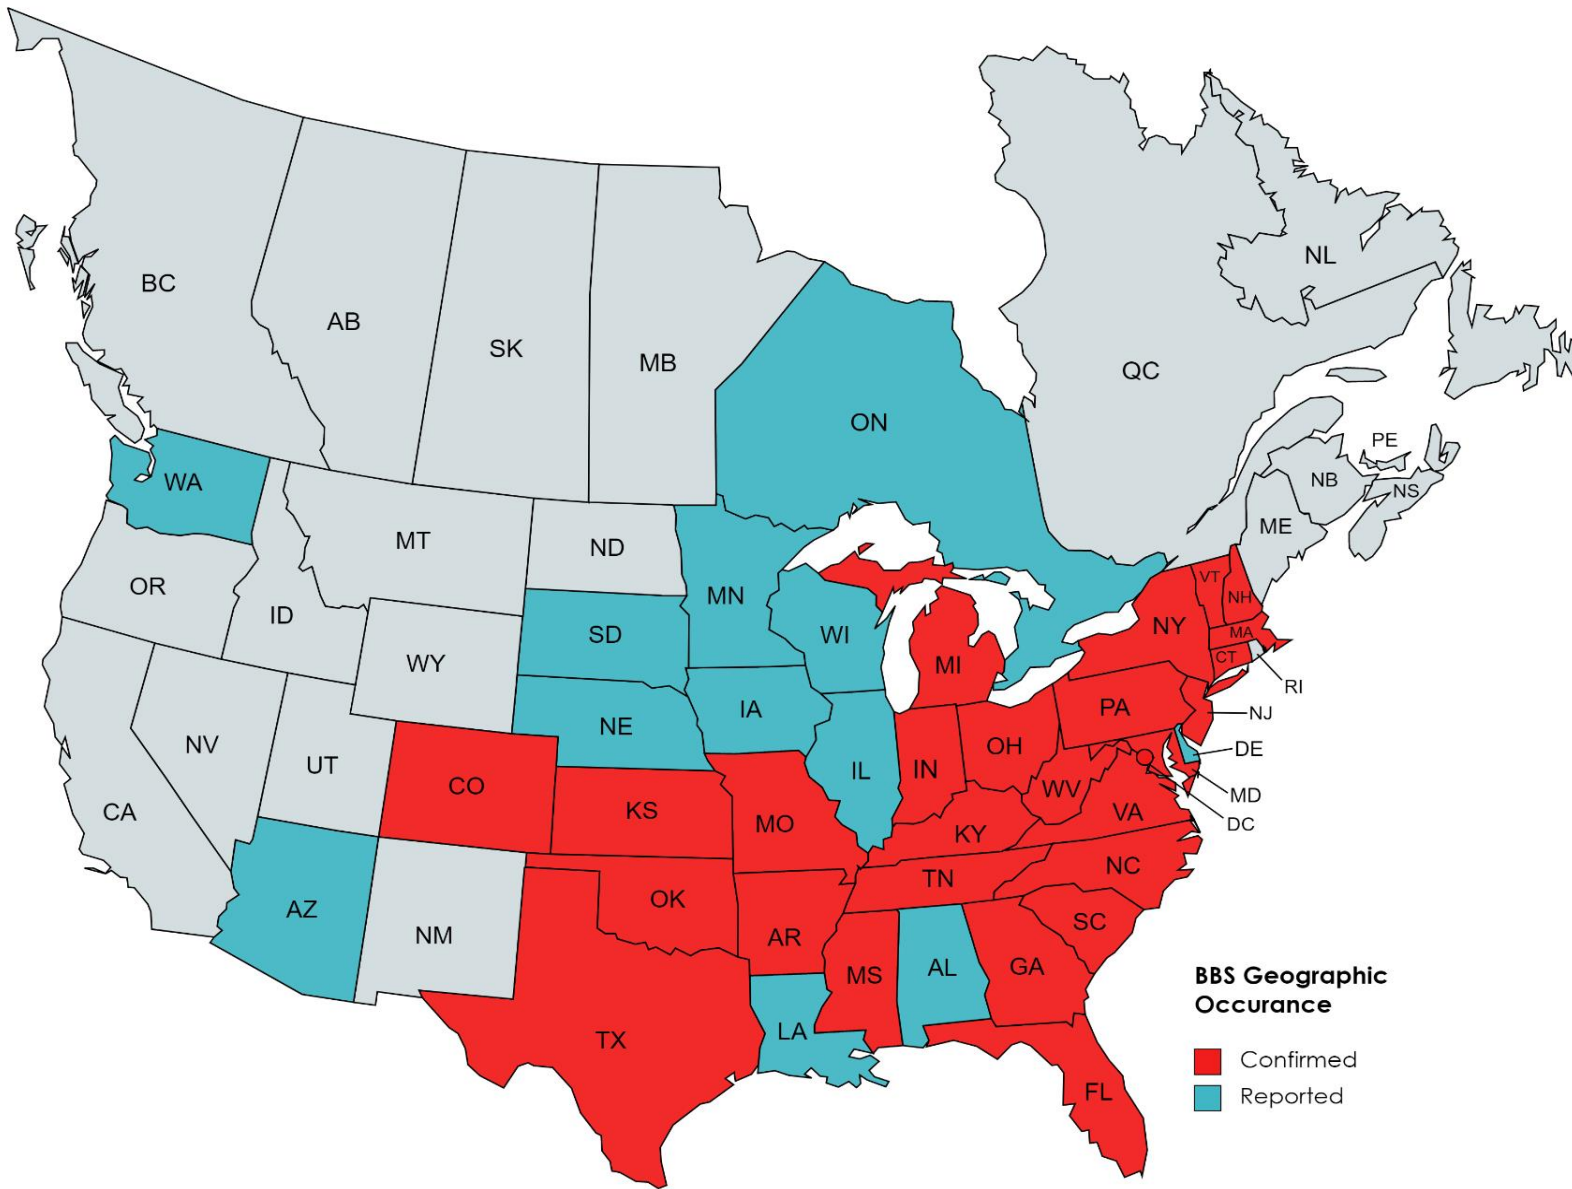

Lake St. Clair, MI

Introduction to Adomaviruses

- The first adomavirus was reported in 2018
- These viruses are not only ‘new’ to fish disease science, but the scientific community in general
- They are similar to the ‘small DNA tumor viruses’ (adenovirus, papillomavirus and polyomavirus)
- Some are associated with lethal disease, or skin diseases of unknown consequence. While most are of unknown significance...

Seeing bass with spots?

PLEASE REPORT BLOTCHY BASS SYNDROME

Cabela's

West Virginia University

What is Blotchy Bass Syndrome?

Hyperpigmentation/melanosis, aka Blotchy Bass Syndrome (BBS) is the occurrence of black ink-like spots on the skin of freshwater bass species. Blotchy Bass Syndrome has been documented in 18 states, including Texas.

While the hyperpigmentation on these fish is associated with a virus, these fish routinely appear to be in great condition and are actively feeding.

Are the fish safe to touch and eat?

Yes, the viruses that are associated with BBS have never been identified in humans or common domestic pets (dogs, cats, birds). They are also safe to eat as long as they are properly cooked.

How does BBS spread?

How the virus spreads between fish is currently under investigation. USGS scientists are researching how the virus reproduces and is transmitted. In any case, anglers should never move fish between water bodies. It is unlawful to place any game fish into public waters other than the body of water where the fish was caught.

How can you help?

Send photos of fish with blotches and the name of the waterbody to:

Cynthia.Fox@tpwd.texas.gov

For More Information on BBS:

Unexpected Issues and Pitfalls

I've seen this in crappie as well.

17w Like Reply 3

black nose crappie quote common actually however I have been seeing more and more

17w Like Reply 1

considered a Mongolian crappie they get larger than the regular white crappie

17w Like Reply 1

I always called them mohawk crappie

17w Like Reply 2

Nothing new. Have caught fish with these spots for over 45 years. May have increased due to the chemicals that they keep dumping into the lakes to control vegetation

17w Like Reply 29

They're not claiming it's new. Only that they're collecting data

17w Like Reply 9

12:45

Helping to learn about "Blotchy Bass Syndrome" translation: Our appointed Tpwd representatives will stop at nothing in their relentless pursuit of more tax dollars to hire more of their family and friends to help pad their own pockets. So rather than accepting that Mother Nature sometimes alters a fish or two we just made a brand new scary "syndrome" which will create unnecessary spending on things that are simply controlled by Mother Nature. Since Mother Nature has all power over this issue rather than the career politicians having control over it we would like to begin the \$7 blotchy bass fishing tag on your fishing license which will allow you to safely fish freshwater and not begin growing these scary virus splotches yourself. And remember, this is all for "research". Thank you for helping us learn about our newly created "Blotchy Bass Syndrome". 😂

Seriously tho. I've been catching bass like that my entire life. Along with every single bass fisherman out there probably. This is not something new. Seems our tax dollars, the time and research could be spent on making our park facilities safer and nicer for us to use.

ANGLERS: If you catch a bass with ink-like spots, please snap a pic and report via the MyCatch app from Anglers Atlas.

Researchers are collecting data on hyperpigmentation/melanosis, a.k.a Blotchy Bass Syndrome, in freshwater bass species associated with a virus.

The virus has never been identified in humans or common domestic pets. As long as the fish are in good condition, they're safe to handle and eat if cooked properly.

AquaDePTH: Aquatic Disease and Pathogen Repository A New Public Resource

Wes Daniel and Matthew Neilson

USGS Wetland and Aquatic Research Center, Gainesville, FL

Jan Lovy

USGS Western Fisheries Research Center, Seattle WA

***Clay Raines**

USGS Eastern Ecological Science Center, WV

Collab: Maureen Purcell (FRESC) & Paul Hershberger (WFRC)

AquaDePTH goals

- A repository to help monitor spatial and temporal aquatic animal health trends
 - Tracking detections of aquatic pathogens
 - Tracking mortality data
 - Monitor for trends over time- climate change
- Curate aquatic animal health data in a single common source for aquatic animal health professionals, researchers, and the public
 - USGS and other federal agencies
 - Tribal, state, and provincial agencies
 - Academic institutions
- Interoperability with other relevant databases
 - USFWS National Wild Fish Health Survey
 - USGS WHISPers (wildlife disease database)

Data from a variety of aquatic hosts

- Data from a variety of aquatic host species
- Early data sets and efforts are on finfish
- Including past data (reports and publications) and new data
- Include other species as needed
 - Corals, freshwater mussels...

Photo Credits: McDowell and Sousa (Frontiers 2019); Steve Fradkin, National Park Service

AquaDePTH to be built on NAS platform

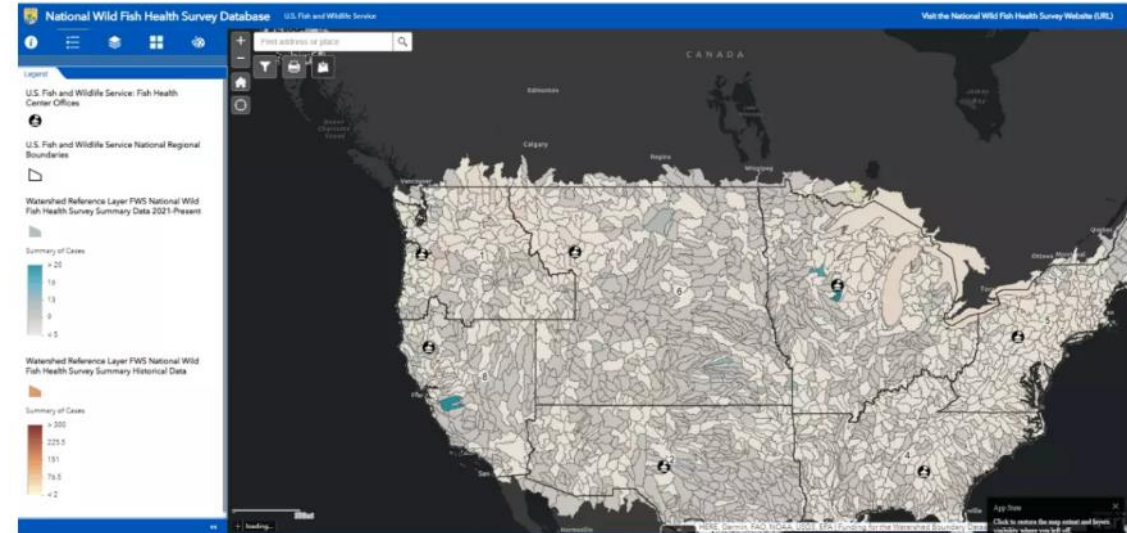

- Trusted partners to Federal, State, Regional and Tribal fisheries managers responsible for aquatic animal health and aquatic invasive species
- NAS is flexible, transparent, accessible and valued
- Watershed resolution and meaningful search filters to explore aquatic connectivity
- NAS upgrades in progress
- Actionable tools to track and predict aquatic transmission pathways
- Threat of aquatic invasive species and pathogens may not be mutually exclusive

Interoperable with other databases

- Overlay data with existing resources
 - USFWS National Wild Fish Health Survey
 - WHISPers USGS wildlife health portal
- Inclusive of diverse aquatic species

WHISPers: wildlife health data portal

AquaDePTH: Timeline

FY22

Building advisory group to inform database development for the duration of the project

FY24

Develop required elements including public landing page and dashboard

FY26

Finalize database and public launch
